| Project Name  | Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer |
| Maximum Marks | 2 Marks                                                                           |

### 1. Problem Statement Overview

In corporate IT service management (ITSM), hardware procurement workflows are frequently hampered by manual administrative steps. Specifically, standard laptop ordering processes suffer from three critical operational bottlenecks:

1. **Manual Task Creation Overhead:** Upon request approval, IT dispatchers or administrators must manually create and populate fulfillment tasks for hardware engineers.
2. **Assignment & Triage Delays:** Requests sit idle in processing queues before being manually assigned to the **Hardware** group.
3. **Inconsistent Task Details & Human Error:** Manual data entry results in missing or vague short descriptions, leading to miscommunication regarding configuration parameters (e.g., standard OS builds, user software).

### 2. Proposed Solution Architecture

The project implements a low-code automation model using **ServiceNow Flow Designer** to bridge the gap between request approval and task fulfillment.

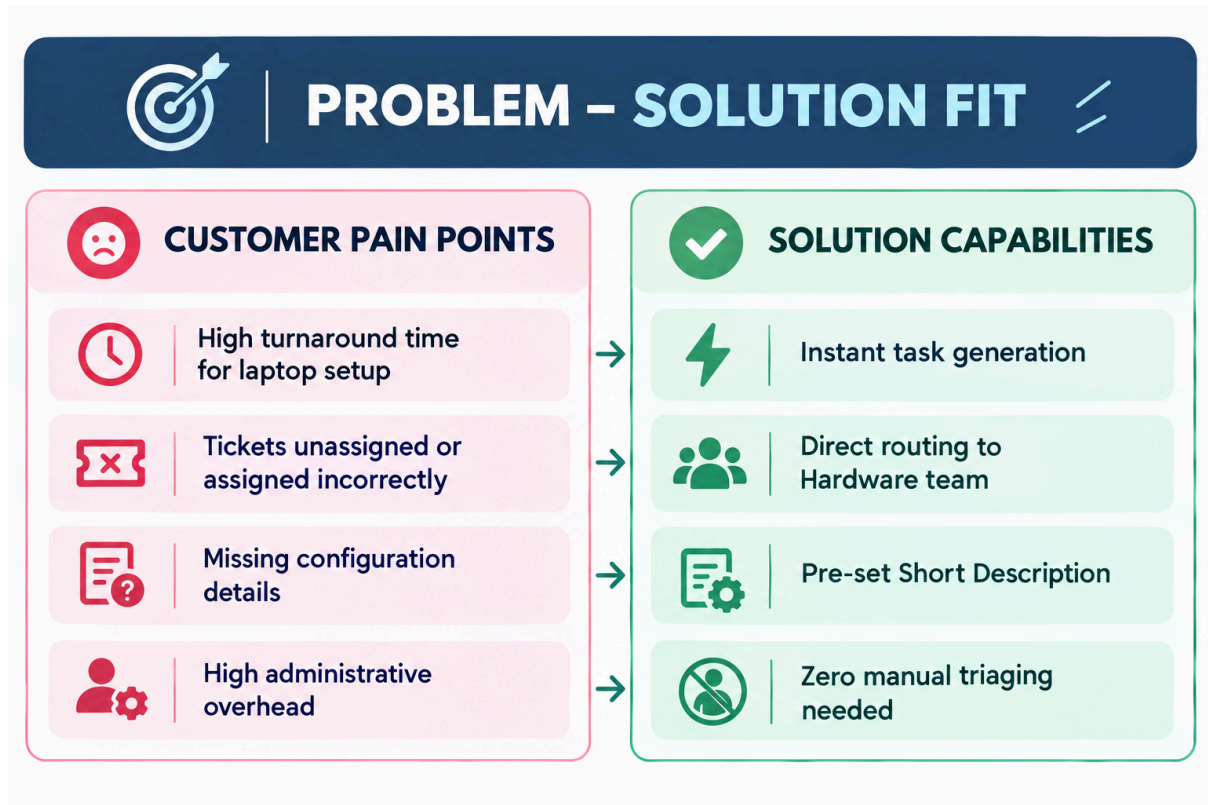

- **Trigger:** Native **Service Catalog** trigger linked to the **Standard Laptop** catalog item.
- **Flow Name:** Standard laptop task (Scope: Global, Run As: System User).
- **Automated Action:** Create Catalog Task (sc\_task).
  - **Request Item:** Dynamically linked via Data Pill (Trigger -> Requested Item Record).
  - **Short Description:** "Laptop need to Configured"
  - **Description:** "Laptop need to Configured"
  - **Assignment Group:** Hardware
  - **Approval Status:** Approved

### 3. Problem – Solution Fit Analysis

The matrix below maps each identified problem directly to its technical feature fit, validating how the ServiceNow Flow Designer configuration eliminates operational friction.

| Identified Problem / Pain Point                       | Root Cause                                                   | Proposed Solution Feature (Flow Designer)                                                                                                                         | Measurable Business Outcome                                                              | Fit Status |
|-------------------------------------------------------|--------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|------------|
| <b>1. Delays in Task Creation</b>                     | Reliance on manual ticket creation after request approval.   | <b>Automated Trigger &amp; Task Generation:</b><br>Flow automatically executes upon request approval, triggering the <b>Create Catalog Task</b> action instantly. | Reduced task generation time from <b>hours/days to under 2 seconds.</b>                  | 100% Fit   |
| <b>2. Triage &amp; Assignment Bottlenecks</b>         | Dispatchers manually route tickets to the engineering queue. | <b>Automated Group Routing:</b><br>Action automatically sets <b>Assignment Group = Hardware.</b>                                                                  | Eliminates manual dispatching; tasks appear directly in the <b>Hardware group queue.</b> | 100% Fit   |
| <b>3. Inconsistent &amp; Missing Task Details</b>     | Dispatchers manually route tickets to the engineering queue. | <b>Pre-populated Data Fields:</b><br>Static and dynamic field mapping enforces <b>Short Description = "Laptop need to Configured".</b>                            | Eliminates configuration oversights and standardizes setup instructions.                 | 100% Fit   |
| <b>4. Security &amp; Privilege Execution Failures</b> | Manual typing by admins during ticket creation.              | <b>System User Execution Scope:</b> Flow runs under <b>System User</b> context in the <b>Global</b> application scope.                                            | Prevents execution failures regardless of the logged-in requester's permissions.         | 100% Fit   |

#### 4. Value Proposition Canvas (Problem-Solution Alignment)

#### 5. Conclusion & Validation Summary

The Problem – Solution Fit assessment confirms that using ServiceNow Flow Designer directly addresses every operational limitation of the legacy manual procurement process. By replacing manual interventions with an automated, low-code workflow, the solution ensures:

- Zero manual task creation overhead.
- Immediate assignment to the Hardware team.
- 100% data consistency across all standard laptop procurement tasks.
